

Artificial Intelligence and Machine Learning Notes

Machine learning is a subset of artificial intelligence that allows systems to learn from data, identify patterns, and make automated decisions.

Supervised learning algorithms rely on labeled datasets to train models such as linear regression, decision trees, and neural networks.

ChromaDB serves as a vector database optimized for similarity search and retrieval-augmented generation (RAG) applications in LLM pipelines.

TensorFlow Lite enables fast on-device inference for mobile Android apps by quantizing weights and reducing memory overhead efficiently.
